- Convert an input file in the circuit symbol format of the circuit and provide the characterization in symbols of the most common and useful parameters.
- Search for the best parameters in the entire parameterized model, and find their range or

evaluate the use of the parameters, for example, when the parameter is not constant or is a function of the temperature. • When a different type of information is entered, the parameter must be remapped, according to the type of information, and the line information must be updated. • The model of a circuit and the component can also be edited in the editor of the program, which allows the user to see what is the real component. • The user can save the circuit and the components in a file and load in the circuit of any other file. • The standard editor for editing circuit is the standard editor. It also allows you to define a new editor. • Use the material editor to add new materials, and modify the materials that already exist in the file. • Use the editor of the program to modify the line number or to define a label to indicate the name of the component. • Connect the components with each other, and you can control the parameters of each connection. • Use the simulator of the component and circuit for analysis of each component and the circuit. • Import the

components or the circuit from the Standard Library, as DXF, GDS, etc. • Synchronization of the component, the circuit and the simulation can be done in a single process of the model, in case the user wants to analyze the circuit by simulation. • The user can save the circuit and the components in a file and load in the circuit of any other file. • The user can see the source of the circuit model of the component, in case of the component editor or the editor of the circuit. • In the case of the component editor or the editor of the circuit the user can modify the components and the circuits of the standard library, according to the user's own needs. • The user can access the editor of the component or the editor of the circuit without creating a circuit in the editor of the circuit. • When using a circuit editor and the component editor, the user must perform the synchronization of the process of the model with the simulation of the component or the circuit. Visual Component Editor Component Editor allows you to create a customized component for usage in the circuit diagrams of the

program. This allows you to create your own
