One of the biggest developments for 2016 is the blockchain technology. The technology is considered as one of the most innovative advances for the year and the next decade. There are a number of reasons why blockchain is gaining popularity at such an unprecedented pace. Firstly, the blockchain is immutable. It works on the assumption that the data being stored in the distributed ledger is not trustworthy and the data cannot be altered. This is because every node will have access to the records, so there is no way of changing them. Secondly, the decentralized structure of the blockchain makes it incredibly secure because there is no single point of failure. It is possible to make fake records and alter them. This is done by creating fake nodes, each of which will change the record. Thirdly, the technology is environmentally friendly. The storage technology used by the blockchain allows for each transaction to be logged in a "block." The block is stored on computers in a "chain" which makes it possible for each node to verify that the transactions are authentic. However, the blockchain saves carbon emissions as well because the transaction log is an essential part of the blockchain. One of the biggest benefits of blockchain technology is its speed. Many companies are finding it beneficial to use blockchain technology to store the data required for a transaction. This process takes time but the speed is almost instantaneous because it does not require a central server. Some of the other benefits include: It is extremely secure and tamper-proof It is very reliable It is transparent It is energy efficient It is fun However, many experts believe that blockchain technology has the potential to revolutionize the whole world. The technology can be used to store all data and transaction records and also do a whole lot more such as voting and fund transfers. It can even be used to store medical records and other personal and financial information. It will also give individuals full control over their data. The blockchain has a vast number of use cases
