

the d65s9 costs more than the x90j, and it's a bit thicker. its local dimming is superior to the x90j, and it has better response time. it also has hdr10 support, and the input lag is a bit lower than the x90j. it also has a higher native resolution. when it comes to gaming, it's the best option in that category. both tvs have phenomenal resolution. the lg's ips panel can display about 90 percent of what 4k sets can do with dolby vision, but the sony's va panel offers 100 percent of the available resolution. the lg has a fast response time, a clear picture, and minimal motion blur, but it's not as bright as the sony when viewed from the wrong angle. the sony, on the other hand, gets brighter as the angle changes and it has better viewing angles. the lg also has a sharper peak brightness, while the sony can get the darkest blacks. both tvs have fast response times that make them ideal for playing fast-moving content like sports. the tcl's quick response time is slightly faster than the lg's, but the sony's has a faster color recovery time and slightly lower input lag. both tvs have better viewing angles than the korean model, which has much wider ones. the sony x900h, also sold as the x90ch at costco, is a top-notch set that gets bright enough to easily overcome glare. it's great for bright rooms, as it has decent reflection handling and gets bright enough to overcome without creating overly-dark screens. it has to input lag, but that's acceptable since it's for watching the occasional game and has a quick response time that makes it good for playing fast-moving content.

PATCHED Sony Picture Package V1.8.1

the lg oled doesn't have perfect black levels, and it's quite vibrant. its viewing angles are decent, and it does have a wider native color gamut compared to the oled, but the 1440p resolution limits how accurate it is. the tcl 6 series/r646 2021 oled looks great for streaming content. it has an excellent local dimming feature that gives off the right amount of black, and it almost never needs to use the "whitepoint adjustment," which is used to increase the white level to compensate for lowered brightness. it's a great tv for watching movies and tv shows, especially with hdr10 content. the tcl 6 series/r646 2021 oled also has hdr support, but it lacks 4k hdr with its 60hz panel. the xbr55x900f is a better value than the x900h. it's a better display than the x900h and the sony x950h, even though it's slightly thinner. the samsung has excellent viewing angles, and it doesn't look washed out from the side, unlike the sony x900h. it also has a bit lower input lag. it can upscale lower-resolution content from cable boxes without issue, and it has hdr to match your content. the q70r is a better choice than the x900h. it has great viewing angles and perfect black levels, and it doesn't look washed out from the sides. the samsung is brighter overall and has better contrast compared to the sony. plus, its local dimming feature is top-notch, it has vrr support once you update it, and it supports freesync, which allows the q70r to match your graphics card's refresh rate. it also features hdr10, hdr10+ and hlg. there's not much to say about the c9, and basically the same things you read about the q70r apply. you have a brighter tv, better viewing angles, and it has a better local dimming feature. the main differences lie in the fact that the c9 has a different appearance compared to the q70r. it has a flat screen, and that's why the tv makes a difference when watching movies and shows. 5ec8ef588b
